

## Adrenal System Support- STRESS

Sensitive by nature, pets, particularly dogs, can absorb the stress and tension around them. Stress in dogs is mainly the product of a change in the environment.

While occasional stress is not a serious condition, excessive or prolonged stress can produce the same negative effects in dogs as it does in humans. Stress triggers your dog's internal defense mechanisms (adrenal glands kick in and cortisol is released), making her heart pound and raising her energy level to full throttle so that he/she uses all reserve strength just to cope. When those reserves are gone, your pet will weaken- adrenal fatigue. Resistance to illness and disease may lower, and may get sick. Without proper nutrition, the body cannot rebuild or repair.

Canine Adrenal Support is very effective and safe to administer to cats.

Signs of adrenal fatigue:

- Hiding
- Not eating
- Fear biting
- Chewing
- Shedding
- Excessive licking
- Dilated pupils
- Shaking
- The list goes on and on...
